Method 3.8 – Juices: phosphates ($P_2O_5$)

1. Rationale

The method is applicable to mixed juice and clear juice and determines the soluble phosphates present in the juice in mg/litre $P_2O_5$. To obtain the total phosphates in the sample an ashing step may be included in the sample preparation.

2. Principle

A standard graph of phosphate concentration versus absorbance is plotted. The same standard graph may be used for raw sugar phosphates (Method 7.14) and boiler water phosphates (Method 9.6). The juice sample is diluted and reacted with ammonium molybdate and the absorbance of the colour of the resulting molybdenum blue complex determined at 700 nm. The phosphate concentration is calculated from the standard graph.

3. Apparatus

3.1 Spectrophotometer with a wavelength of 700 nm

3.2 Optical glass cell: 10 mm

3.3 Pipettes with pipette stand: 5, 10, 20, 25 and 50 cm$^3$

3.4 Volumetric flasks: 100, 200, 2 × 1 000 and 2 000 cm$^3$

3.5 Stopwatch

3.6 Filter paper: Whatman no 91 or equivalent

3.7 Analytical balance readable to 0.0001 g

3.8 Top pan balance readable to 0.01 g

3.9 Funnel: 50-60 mm φ

3.10 Glass wool or Whatman No. 91 filter paper or equivalent

3.11 Beaker: 1 litre

4. Reagents

4.1 Sulphuric acid (concentrated)

*Sulphuric acid ($H_2SO_4$) is a corrosive acid and should only be handled with gloves while wearing safety glasses.*
4.2 **Phosphate stock solution** (400 mg/litre P$_2$O$_5$)

*Potassium dihydrogen orthophosphate (KH$_2$PO$_4$) is corrosive and should be handled with gloves to avoid skin contact and safety glasses. Avoid swallowing and inhalation of the fumes by working in a fume cupboard.*

Dissolve 0.7668 g potassium dihydrogen orthophosphate in distilled water and transfer to a 1 000 cm$^3$ volumetric flask. Add 10 cm$^3$ concentrated sulphuric acid and dilute to volume to make a 400 mg/litre P$_2$O$_5$ solution. This standard will keep indefinitely.

4.3 **Phosphate standard solution** (10 mg/litre P$_2$O$_5$)

Dilute 25 cm$^3$ of the 400 mg/litre P$_2$O$_5$ standard to 1 000 cm$^3$. This standard is used for the calibration graph.

4.4 **Hydrochloric acid** (concentrated, 32%)

*Hydrochloric acid (HCl) is a corrosive acid and should only be handled with gloves while wearing safety glasses.*

4.5 **Ammonium molybdate solution** (1.5% m/m)

*Ammonium molybdate tetrahydrate [(NH$_4$)$_2$MoO$_4$·4H$_2$O] is an irritant and contact with the skin or through inhalation or swallowing must be avoided. Work in a fume cupboard while wearing gloves and safety glasses.*

Dissolve 15.0 g powered ammonium molybdate tetrahydrate in 300 cm$^3$ distilled water at 50°C in a 1 litre beaker and cool. Carefully add 310 cm$^3$ concentrated hydrochloric acid. This dilution is exothermic and the solution will heat up. Cool to room temperature and transfer to a 1 000 cm$^3$ volumetric flask and make to the mark.

4.6 **Reducing solution**

*Sodium metabisulphite (Na$_2$S$_2$O$_5$), sodium sulphite (Na$_2$SO$_3$) and 1-amino-2-naphthol-4-sulphonic acid (C$_6$H$_4$C$_4$HNH$_2$OHSO$_3$H) are irritants and contact with the skin, eyes and through swallowing should be avoided. Sodium metabisulphite is toxic to humans.*

Solution A: dissolve 180.0 g sodium metabisulphite in 1400 cm$^3$ distilled water.

Solution B dissolve 14.0 g anhydrous sodium sulphite and 3 g 1-amino-2-naphthol-4-sulphonic acid in 200 cm$^3$ distilled water.

Mix solutions A and B in a 2000 cm$^3$ volumetric flask and make to the mark with distilled water. Stand overnight and filter through glass wool or a Whatman No. 91 filter paper or equivalent. Store in a dark bottle and in a refrigerator. This solution has a maximum shelf life of 2 months. Remove the required amount of reducing solution from the refrigerator about 1 hour before use and allow warming to room temperature.

5. **Procedure**

5.1 **Preparation of standard graph**

Pipette aliquots of the 10 mg/litre phosphate standard solution into 100 cm$^3$ volumetric flasks according to the amounts indicated in Table 1.

\[
P_2O_5 \text{ concentration (mg/litre)} = \frac{\text{aliquot} \times \text{concentration}}{\text{volume}} = \frac{\text{aliquot} \times 10 \text{ mg/litre}}{100 \text{ cm}^3}
\]
Table 1: Calibration graph solutions

</tbody>
</table>

To each flask add 10 cm³ of the ammonium molybdate solution and sufficient distilled water to bring the total volume in the flask to about 85 cm³. Add 10 cm³ reducing solution to the first flask and start the stopwatch. Quickly make to volume with distilled water and mix. Measure the absorbance exactly 10 minutes after addition of the reducing solution at 700 nm in a 10 mm cell using distilled water as the reference. Repeat these steps for all the other flasks using distilled water as the blank. Plot a graph of absorbance (AU) against P₂O₅ concentration (mg/litre).

5.2 Juice sample

Filter the juice through a fluted filter paper in the funnel. Reject the first 10 cm³ as first runnings and collect about 20 cm³ of the clear filtrate in the case of mixed juice and 150 cm³ in the case of clarified juice. Measure the Brix of the sample in the refractometer.

The aliquot used will depend on the concentration of phosphates in the sample. As a guide South African mixed juice contains about 200 - 300 mg/litre P₂O₅ and clarified juice about 40 mg/litre P₂O₅. Therefore, for mixed juice pipette 10 cm³ filtrate into a 200 cm³ volumetric flask. For clarified juice pipette 100 cm³ filtered sample into a 200 cm³ volumetric flask. Make to the mark with distilled water and mix thoroughly.

Pipette 20 cm³ of this solution into two 100 cm³ volumetric flasks, one of which will be a blank. To the first flask, add approximately 50 cm³ water, 10 cm³ of the ammonium molybdate solution and 10 cm³ of the reducing solution. Start the stopwatch. Mix by swirling and dilute to volume. Measure the absorbance exactly 10 minutes after addition of the reducing solution at 700 nm in a 10 mm cell using distilled water as the reference. Make the second flask to volume (blank) with distilled water. Determine the absorbance of the blank at 700 nm in a 10 mm cell using water as a reference.

6. Expression of Results

Subtract the blank from the absorbance and read the corresponding P₂O₅ concentration from the standard graph.

\[
P₂O₅ (\text{mg/litre on sample}) = P₂O₅ \text{ conc} \times \left( \frac{200 \text{ cm}^3}{\text{aliquot}} \times \frac{100 \text{ cm}^3}{20 \text{ cm}^3} \right)
\]

where the P₂O₅ concentration is obtained from the calibration graph

Report results to the nearest unit in mg/litre on sample.
7. Example

7.1 Standard graph

Actual mass \( \text{KH}_2\text{PO}_4 \) weighed = 0.7720 g
Actual concentration \( \text{P}_2\text{O}_5 \) standard = 10.07 mg/litre

Table 2: Example standard graph

<table>
<thead>
<tr>

<td>0.350</td>
</tr>
</tbody>
</table>

\( \text{P}_2\text{O}_5 \) concentration (mg/litre) = \( \frac{\text{aliquot} \times 10.07 \text{ mg/litre}}{100 \text{ cm}^3} \)

\[
y = 0.0695x \\
R^2 = 1
\]

Figure 1: Standard phosphate graph

7.2 Mixed juice sample

Brix of the sample = 13.5\(^{\circ}\)Bx
Absorbance of blank = 0.046 AU
Absorbance of sample = 0.256 AU

\( \text{P}_2\text{O}_5 \) in solution = 3.02 mg/litre
\( \text{P}_2\text{O}_5 \) in sample = 302.16 mg/litre

Report as 302 mg/litre on sample
8. Precision

The tolerance associated with the analysis is ± 11 mg/litre.
